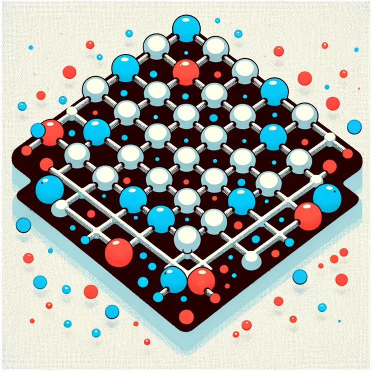
Compute quantum mechanics

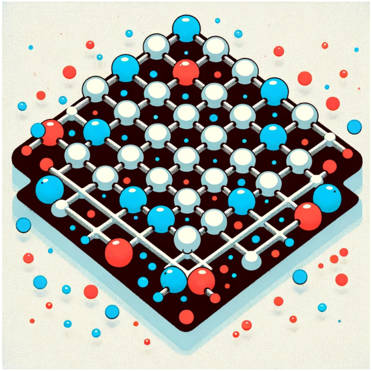
Compute quantum mechanics

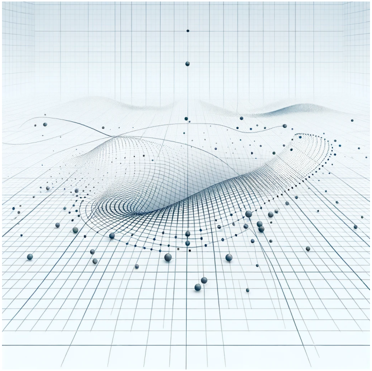
- Representing N particles is difficult;



Compute quantum mechanics

- Representing N particles is difficult;
- considering N spins $(\uparrow, \downarrow)$, we deal with a 2^N dimensional Hilbert space!





What can we do?

What can we do?

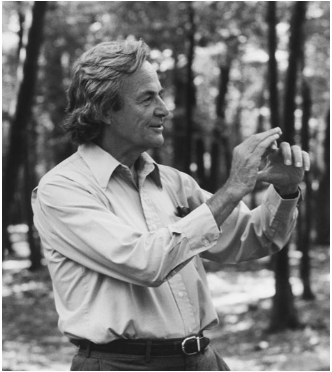
1. we can try to use classical methods to represent the system;

What can we do?

1. we can try to use classical methods to represent the system;
2. we can build a quantum computer.

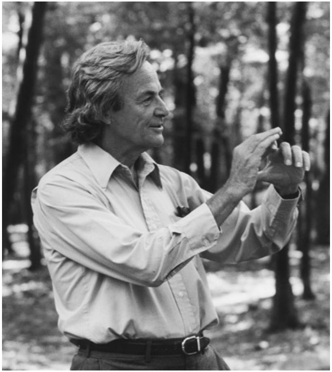
What can we do?

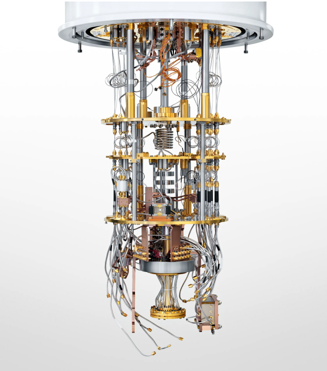
1. we can try to use classical methods to represent the system;
2. we can build a quantum computer.



What can we do?

1. we can try to use classical methods to represent the system;
2. we can build a quantum computer.





Nature isn't classical, dammit, and if you want to make a simulation of nature, you'd better make it quantum mechanical, and by golly it's a wonderful problem, because it doesn't look so easy.

Richard Feynman, 1982, Simulating Physics with Computers

What can we do?

1. **we can try to use classical methods to represent the system**;
2. we can build a quantum computer.

Richard Feynman, 1982, Simulating Physics with Computers

Can we represent a state with a classical computer?

Let's suppose we want to represent a system of **qubits** ($\uparrow, \downarrow$).

Can we represent a state with a classical computer?

Let's suppose we want to represent a system of **qubits** $(\uparrow, \downarrow)$.

1. Each `float 64` requires 8 bytes of memory to be stored;

Can we represent a state with a classical computer?

Let's suppose we want to represent a system of **qubits** $(\uparrow, \downarrow)$.

1. Each `float 64` requires 8 bytes of memory to be stored;
2. each `complex 128` requires 16 bytes of memory;

Can we represent a state with a classical computer?

Let's suppose we want to represent a system of **qubits** $(\uparrow, \downarrow)$.

1. Each `float 64` requires 8 bytes of memory to be stored;
2. each `complex 128` requires 16 bytes of memory;
3. let's take a nice 32Gb of RAM: it can store up to 2 billions of `complex 128`.

Can we represent a state with a classical computer?

Let's suppose we want to represent a system of **qubits** $(\uparrow, \downarrow)$.

1. Each `float 64` requires 8 bytes of memory to be stored;
2. each `complex 128` requires 16 bytes of memory;
3. let's take a nice 32Gb of RAM: it can store up to 2 billions of `complex 128`.
4. a 30 qubits state requires ~ 1 billion of complex numbers;

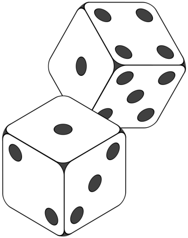
Some smart strategies

Some smart strategies

1. Variational Monte Carlo (VMC): given a wave function $\Psi(\boldsymbol{x}|\boldsymbol{\theta})$ and a target H, MC methods are used to minimize:

$$\frac{\int \mathrm{d}\boldsymbol{x}\, \Psi^*(\boldsymbol{x}|\boldsymbol{\theta})\, H\, \Psi(\boldsymbol{x}|\boldsymbol{\theta})}{\int \mathrm{d}\boldsymbol{x}\, |\Psi(\boldsymbol{x}|\boldsymbol{\theta})|^2} \geq E_0;$$



arXiv:1508.02989

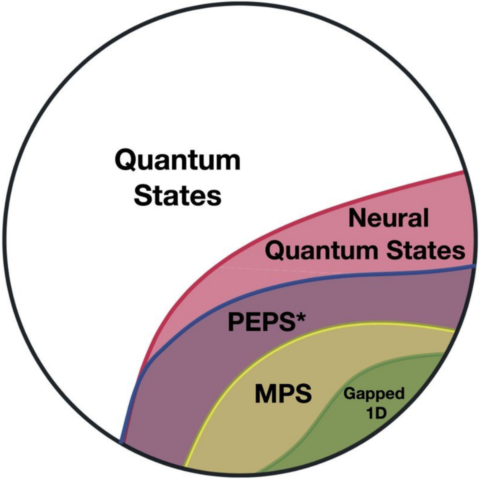
Is this enough?



A snapshot of quantum computing

Qubits

1. classical bits are replaced by **qubits** $|\psi\rangle = \alpha\,|0\rangle + \beta\,|1\rangle$.

Superconducting loops
A resistance-free current oscillates back and forth around a circuit loop. An injected microwave signal excites the current into super-position states.

Trapped ions
Electrically charged atoms, or ions, have quantum energies that depend on the location of electrons. Tuned lasers cool and trap the ions, and put them in superposition states.

Silicon quantum dots
These “artificial atoms” are made by adding an electron to a small piece of pure silicon. Microwaves control the electron’s quantum state.

Topological qubits
Quasiparticles can be seen in the behavior of electrons channeled through semi-conductor structures.Their braided paths can encode quantum information.

Diamond vacancies
A nitrogen atom and a vacancy add an electron to a diamond lattice. Its quantum spin state, along with those of nearby carbon nuclei, can be controlled with light.

Qubits

1. classical bits are replaced by **qubits** $|\psi\rangle = \alpha\,|0\rangle + \beta\,|1\rangle$.
2. we can manipulate the qubit state applying **gates**: $|\psi'\rangle = \mathcal{U}(\boldsymbol{\theta})\,|\psi\rangle$.
   Typically we use 1-qubit and 2-qubits gates!

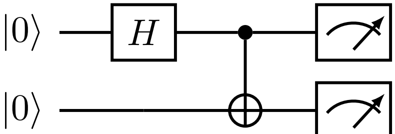
$$\mathrm{CNOT}\left(\underbrace{\frac{1}{\sqrt{2}}(|0\rangle + |1\rangle)}_{\text{control}} \otimes |0\rangle\right) = \frac{1}{\sqrt{2}}(|{\color{blue}0}0\rangle + \mathrm{NOT}_{\mathrm{targ}}\,|{\color{red}1}0\rangle) = \frac{1}{\sqrt{2}}(|00\rangle + |11\rangle).$$



Parametric gates prepare variational quantum states

Parametric gates prepare variational quantum states

- Among the gates, parametric ones can be useful!

Parametric gates prepare variational quantum states

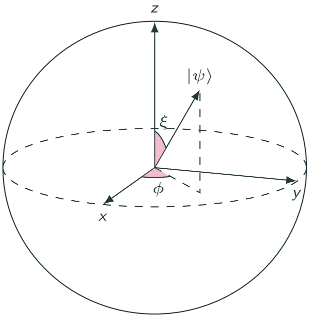
- Among the gates, parametric ones can be useful!
- Let's consider a single qubit system:

$$|\psi\rangle = \alpha\,|0\rangle + \beta\,|1\rangle$$

Parametric gates prepare variational quantum states

- Among the gates, parametric ones can be useful!
- Let's consider a single qubit system:

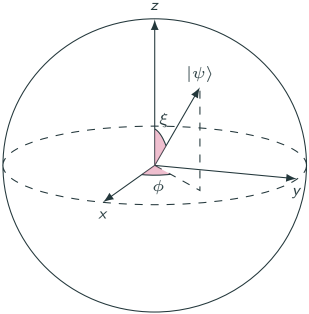
$$|\psi\rangle = \alpha\,|0\rangle + \beta\,|1\rangle \qquad \text{with} \qquad \alpha = \cos\frac{\theta}{2}, \quad \beta = e^{i\phi}\sin\frac{\theta}{2}.$$

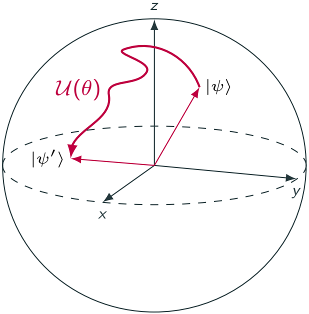


Parametric gates prepare variational quantum states

- Among the gates, parametric ones can be useful!
- Let's consider a single qubit system:

$$|\psi\rangle = \alpha\,|0\rangle + \beta\,|1\rangle \qquad \text{with} \qquad \alpha = \cos\frac{\theta}{2}, \quad \beta = e^{i\phi}\sin\frac{\theta}{2}.$$





We can use as parametric gates the rotation around the axis of the block sphere:

$$R_k(\theta) = \exp\big[-i\theta\sigma_k\big], \qquad \text{with} \qquad \sigma_k \in \{I, \sigma_x, \sigma_y, \sigma_z\}.$$

But can this work?

But can this work?

1. Depend on the problem

But can this work?

1. Depend on the problem, e.g. playing in the Hilbert space makes sense when tackling a many body problem!

But can this work?

1. Depend on the problem, e.g. playing in the Hilbert space makes sense when tackling a many body problem!
2. We can take some more rational proof of utility.
